Grafting Mastix BZ gives a pliable wax seal impervious to water. **DO NOT** heat. **Grafting Mastic BZ** can be readily worked around the grafts by the fingers.

DIRECTIONS FOR USE

The object of grafting is to improve particular tree or shrub by uniting a portion of it, the SCION, with the STOCK of the same or similar species of plant.

The principle of grafting consists of placing the cambium layers of the two cut surfaces so closely together they join and grow as one. This is achieved by excluding air and water.

For best results:

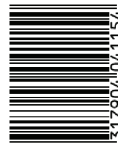

1. Upon completion of the graft, cincture etc., thoroughly seal all c edges of the graft or binding material with Grafting Mastic BZ to ensure complete exclusion of air and moisture.
2. Do not use excessive quantities of Grafting Mastic BZ, otherwise t results may be impaired.

Grafting can be performed at any time when stock is in dormant state, but it is more successful immediately prior to the commencement of early spring growth.

The STOCK should be at a growth stage in advance of the SCION. This is normally achieved by cutting the scions some weeks before grafting and keeping in soil until required. When used, cut into 10-15cm lengths.

ALWAYS REPLACE LID AFTER USE.

Batch No.
